Test Report

Test Name	Results	Units	Bio. Ref. Interval
TSH, ULTRASENSITIVE, SERUM (CLIA)	2.057	µIU/mL	0.550 - 4.780

Note

1. TSH levels are subject to circadian variation, reaching peak levels between 2 - 4 a.m. and at a minimum between 6-10 pm . The variation is of the order of 50%, hence time of the day has influence on the measured serum TSH concentrations.
2. Values <0.03 µIU/mL need to be clinically correlated due to presence of a rare TSH variant in some individuals.
3. Transient increase in TSH levels or abnormal TSH levels can be seen in various nonthyroidal diseases. Simultaneous measurement of TSH with free T4 is useful in evaluating the differential diagnosis

Date	: November 30, 2024	Ref. by : SELF
Investigation	: Sonography examination of whole abdomen.	

Hepatobiliary

The liver is mildly enlarged in size 15.04cm however normal in shape & position.
It shows mildly increased reflectivity, suggestive of grade-I fatty changes in the liver.
No focal lesion is seen in the liver. No intrahepatic biliary tract dilatation seen.
Gall bladder is physiologically well distended and appears normal.
No evidence of any calculus, mass lesion or any other abnormality seen in the gall bladder.
Gall bladder wall appears normal and no pericholecystic fluid is seen.
Common bile duct and Portal vein appear normal in course and caliber.

Pancreas

Pancreas is normal morphologically. No mass lesion or calcification is seen in the pancreas.
Pancreatic duct is not dilated.

Spleen

Spleen is unremarkable and appears normal in size, shape and echotexture.

Kidneys

The kidneys are visualized and appear normal in size, shape, outline and echotexture.
Right kidney measures 118mm x 48mm. Parenchymal thickness is normal.
Left kidney measures 117mm x 61mm. Parenchymal thickness is normal.
Corticomedullary differentiation is well maintained on either side.
No mass lesion, calculus or hydronephrosis is seen in either kidney.

Urinary Bladder

Urinary bladder is physiologically well distended and normal.
No mass lesion, calculus or diverticulum is noted in the urinary bladder.
Urinary bladder wall thickness is normal.

Prostate

Prostate appears normal in size, shape and echotexture. Prostate measures 39mm x 30mm x 25mm.
Effective volume of prostate from above is about 15.80cc.
No free fluid is seen in the abdomen and pelvis. No significant lymphadenopathy is seen.

Clinical and lab correlation is recommended for further evaluation.

Comment

In anaemic conditions Mentzer index is used to differentiate Iron Deficiency Anaemia from Beta- Thalassemia trait. If Mentzer Index value is >13, there is probability of Iron Deficiency Anaemia. A value <13 indicates likelihood of Beta- Thalassemia trait and Hb HPLC is advised to rule out the Thalassemia trait.

Note

- As per the recommendation of International council for Standardization in Hematology, the differential leucocyte counts are additionally being reported as absolute numbers of each cell in per unit volume of blood
- Test conducted on EDTA whole blood

Test Report

Test Name	Results	Units	Bio. Ref. Interval
HbA1c (GLYCOSYLATED HEMOGLOBIN), BLOOD (HPLC, NGSP certified)		%	4.00 - 5.60
HbA1c	10.2	%	
Estimated average glucose (eAG)	246	mg/dL	

Interpretation

HbA1c result is suggestive of Diabetes/ Higher than glycemic goal in a known Diabetic patient.

Please note, Glycemic goal should be individualized based on duration of diabetes, age/life expectancy, comorbid conditions, known CVD or advanced microvascular complications, hypoglycaemia unawareness, and individual patient considerations

Result Rechecked,
Please Correlate Clinically.

Interpretation as per American Diabetes Association (ADA) Guidelines

Reference Group	Non diabetic adults >=18 years	At risk (Prediabetes)	Diagnosing Diabetes	Therapeutic goals for glycemic control
HbA1c in %	4.0-5.6	5.7-6.4	>= 6.5	<7.0

Note: Presence of Hemoglobin variants and/or conditions that affect red cell turnover must be considered, particularly when the HbA1C result does not correlate with the patient's blood glucose levels.

FACTORS THAT INTERFERE WITH HbA1C MEASUREMENT	FACTORS THAT AFFECT INTERPRETATION OF HbA1C RESULTS
Hemoglobin variants, elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements	Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g., recovery from acute blood loss, hemolytic anemia, HbSS, HbCC, and HbSC) will falsely lower HbA1c test results regardless of the assay method used. Iron deficiency anemia is associated with higher HbA1c

मुझे मेरी भाषा में बता दिया गया है कि मेरे मरीज की हालत बहुत गंभीर है और जान जाने की बहुत संभावना है। मेरे मरीज को इलाज के लिए सामान्य वार्ड (General Ward) में भर्ती किया जाएगा जिसके लिए मैं सहमत हूँ।

सामान्य वार्ड में वेंटिलेटर (Ventilator) उपलब्ध नहीं है। मुझे गुब्बारा (AMBU) देवा कर अपने मरीज को साँस देनी होगी।

सफावरजंगा अस्पताल में उपलब्ध सुविधाओं और ऊपर समझाए गए खतरों की समझते हुए मैं अपने मरीज को यहाँ भर्ती कराने को सहमत हूँ।
